Abstract: In Kosovo, in various manufacturing enterprises, public facilities and institutions are going to apply a considerable number of sources of radioactive radiation. They are X-ray generators and different isotopes that are used in medicine, industry, education etc.. Do not care needed for these sources of radiation, and the stages through which our country has passed (Kosovo) and going through, has made often to these radiation sources do not 'have' the right approach, as a result we an environmental contamination by radioactive radiation. But some times without workers known, they treat radioactive source like as metal waste, it is dangerous for contamination of environment and biological hazard of peoples.

Key Words: *activity, source, detector, isotope, radioactive lighting conductor.*
