Abstract: The purpose of the work 'The values of tourism in the area of Drenica' is to present the natural touristic values of this part of Kosovo, because this area has natural tourist values such as: Drenica River, Cave of Pjetershtica, Cave of Baica, Cave of Kishnareka, mineral resource in Poklek, as well as natural spring of Baica, etc. These are potential values for the development of tourism in this area, whereas if there is a promotion of these values, the number of visitors would increase. This would directly help economic development of this area. Based on research and the use of my experience, this work tries to identify the values of tourism in the area of Drenica. The area of Drenica is located in the center Drenica Region of Kosova. This area collects water from Drenica valley and surrounding areas: western and southern coastlines of Çiçavica, western and northern coastlines of Golesh, Carraleva and Blinaja, as well as east coastlines of Drenica Mountains, the mountain of Kosmaç. In the North-West, parts of coastlines are located on the border across the mountain between the Kosova Valley and Dukagjini Valley. The surface of water collector is 447 km². The average width of the collector is 24, 9 km. The coefficient and asymmetry of the river $a = 0.84$. The length of water separator is 109.3 km. The length of the stream is 50.5 km, whereas the length of all streams in total is 365.6 km.

Key Words: *Dam, Drenica River, Cave, Tourism, Kosova.*
