**Abstract:** This paper deals with the possibility on the search of the stratigraphic iron level known at Sorokoli and Kalabaku areas at Muhurri area as well, attempting the opening of the iron-bearing perspective in depth. The available results obtained by the iron occurrences of Muhurri area and the data obtained by the geological survey, scale 1:25 000, support the idea of the controlling of the expected iron ore structure more in depth than the iron showings known so far and these later represent other iron levels, nevertheless their productivity or industrial interest.

**Keywords:** *Iron silicates, Palaeozoic, shales, cherts, graptolite, lithology.*
