Abstract: The large reserves of coal (lignite) and also convenient conditions of the exploitation of coal present very strong arguments for the justification of private capital investment in the energy sector of the Republic of Kosovo. The trend of the increase of living standards of population, development of industry and also the demands in South-Eastern Europe market submit the need to build new generative capacities of energy. Therefore, the purpose of this scientific paper is to present the opportunist of supply with coal generative capacities of 1500 MW, in perspective of the potential areas of Sibofc.
