**Abstract:** The purpose of this research is to determine the level of conative component among high school youth in the Republic of Macedonia. The conative component of youth was determined by using the Scale of Activation instrument. The survey covered 484 participants from 19 high schools from 18 towns in the country. The prevailing level of readiness for action is the self-initiative active attitude (31.90%). The percentage of students that showed indifferent attitude is about 19.32%. The mean level of readiness for action when the environment is threatened is 2.56 points or 64%. There is a decline in conative component of environmental education of students compared with the previous period. The reasons for this condition should be found among many factors both within schools itself and in the wider environment.
